Zona Industriale Valle Cupa - 64010 COLONNELLA (TE)

INDUSTRIA PRODUZIONE AMMENDANTE COMPOSTATO

MONITORAGGIO OLFATTOMETRICO ESEGUITO
NEL MESE DI SETTEMBRE 2014 PRESSO:

A) SITO AZIENDALE DAL 01/09/2014 AL 11/09/2014;

B) PRESSO FAMIGLIA DE LUCA S.P. 1 CONTROGUERRA
(TE) DAL 11/09/2014 AL 30/09/2014.

Il direttore tecnico
Ing. Mauro Scacchia

Il sito industriale della STAM Srl è dotato di un sistema olfattivo per uso esterno EOS Ambiente 507F di SACMI, dove EOS è l'acronimo di Electronic Olfactory System, vale a dire un apparato elettronico composto da n. 6 sensori MOS (Metal Oxide Semiconductors), che si basa sulla variazione di conducibilità dell'ossido in funzione delle diverse sostanze odorigene; esso costituisce un sistema idoneo alla misura delle emissioni olfattive in campo aperto, che consente di effettuare in continuo ed in automatico il riconoscimento qualitativo delle sorgenti odorigene, nonché di determinare in termini quantitativi la concentrazione di odore dell'aria analizzata, simulando il processo mentale di memorizzazione e riconoscimento proprio del sistema olfattivo umano: così come i ricettori umani inviano segnali al cervello, i sensori dello strumento, stimolati dalla diffusione delle sostanze volatili, inviano un segnale elettrico all'elaboratore elettronico; tali sensori non sono selettivi verso uno specifico analita, bensì verso classi di analiti, ed a ciascuna classe di odori viene poi assegnato un nome, che serve a distinguere le varie emissioni registrate. Lo strumento quindi non identifica la composizione chimica del composto, ma ne associa la somiglianza a composti già analizzati, creando una sorta di "impronta olfattiva" della miscela, da confrontare con una libreria di odori precedentemente costruita durante la fase di "addestramento", nella quale un software dedicato ha il compito di memorizzare l'impronta olfattiva di un campione, formato a sua volta da una miscela di composti, che spesso sono presenti a concentrazioni inferiori al limite di rilevabilità analitica, ma che avendo un'alta soglia di percezione riescono a stimolare i sensori del naso. Il monitoraggio in continuo degli odori viene condotto secondo le "Linee guida per il monitoraggio delle emissioni gassose provenienti dagli impianti di compostaggio e bioessiccazione" elaborate dall'ARTA Abruzzo, nonché del Manuale APAT "Metodi di misura delle emissioni olfattive" n.19/2003 che approfondisce le tecniche di determinazione per la rilevazione dei composti odorigeni e i modelli matematici di ricaduta al suolo.

SENSORE OLFATTOMETRICO SACMI EOS 507F

La planimetria dello stabilimento indica la posizione normalmente occupata dal naso elettronico (cerchio rosso in alto a sinistra), nonché delle varie sorgenti odorigene campionate. I punti di campionamento sono stati stabiliti in modo tale da essere rappresentativi di tutte le emissioni odorigene di cui si intende rilevare la presenza nell'ambiente circostante al sistema di misura.

Per quanto riguarda l'addestramento del sensore olfattometrico elettronico, le varie sorgenti odorigene campionate sono state individuate sulla base dei seguenti quattro odori presenti all'interno del sito industriale:

- Zona Ricezione materiali in lavorazione;
- Zona Ossidazione;
- Zona Maturazione;
- Biofiltri (Zona maturazione e Zona ossidazione).

I primi tre odori sono stati campionati in locali chiusi mediante raccolta di aria ambiente, mentre per i biofiltri, che costituiscono flussi di aeriformi da sorgente estesa, gli odori vengono campionati mediante l'uso di una cappa a base quadrata, secondo quanto previsto dalla norma UNI EN 13725:2004.

I campioni aeriformi odorigeni sono sottoposti a prova mediante olfattometria dinamica presso un laboratorio dotato di Camera Olfattometrica, cioè un ambiente che risponde ai requisiti fissati dalla norma UNI EN 13725:2004. L'addestramento dello strumento rappresenta la prima fase fondamentale del monitoraggio, dato che il naso elettronico non riconosce i singoli composti chimici che costituiscono l'odore, ma restituisce l'impronta olfattiva dell'aria che analizza, per cui, per un corretto funzionamento è necessario creare un database delle impronte olfattive che l'aria potrebbe assumere per effetto delle emissioni di odore circostanti.

A tal fine, sono stati sottoposti al naso elettronico una serie di campioni di qualità olfattiva nota (stabilita in fase di analisi di laboratorio), il quale li aspira e li diluisce automaticamente, in modo da creare delle rette di calibrazione a diversi valori noti di concentrazione di odore. Successivamente vengono attribuite delle etichette di riconoscimento, e inserite le relative concentrazioni note, al fine di stabilire le classi olfattive, che nel caso in esame sono quelle di cui ai dati di output.

Di seguito vengono riportati i certificati rilasciati dal laboratorio LOD di Udine, regolarmente abilitato all'effettuazioni di analisi olfattometriche secondo la norma UNI EN 13725:2004, sui prelievi di campioni gassosi prelevati in data 5 Dicembre 2013 e 11 Marzo 2014.

Responsabile tecnico
ing. Silvia Rivilli

In data 18/07/2014 i Funzionari del Settore Ambiente dell'Amministrazione Provinciale di Teramo e dell'ARTA Abruzzo Dipartimento di Teramo effettuavano un sopralluogo presso lo stabilimento della scrivente, a seguito di alcune segnalazioni di percezione di emissioni maleodoranti da parte di residenti limitrofi al sito produttivo, in particolare della Famiglia De Luca, domiciliata in territorio di Controguerra (Te), in Via S.P. 1, distante in linea d'aria circa 500 metri, la cui abitazione è evidenziata dal cerchio rosso in alto a sinistra, come da seguente foto aerea.

La scrivente, presa conoscenza di tale problematica, si è prontamente attivata per individuare tutte le possibili fonti di emissioni diffuse nell'ambiente circostante, eseguendo i seguenti lavori di manutenzione:

- A) ricontrollo dello stato di integrità di tutte le tubazioni di estrazione delle arie esauste e di immissione al trattamento di biofiltrazione, presso le quali si evidenziavano alcune crepe strutturali ed allargamenti in corrispondenza delle giunzioni;
- B) rifacimento delle chiusure di tutti i possibili punti di perdita sulla copertura superiore del capannone, in particolare sulle guarnizioni dei lucernari e delle onduline, nonché sulle tubazioni della preesistente industria tessile, attualmente inutilizzate (prese d'aria, scarichi vari, camini della centrale termica smantellata);
- C) applicazione presso le n. 2 porte delle zone maturazione di diffusori di acqua nebulizzata addizionata di miscele enzimatico-batteriche miscelate con deodoranti.

Nel contempo, in data 21/07/2014, a seguito di accordi intercorsi con gli Enti sopracitati, si provvedeva ad effettuare un periodo di monitoraggio in continuo direttamente presso il sito della famiglia De Luca, mediante l'installazione del sensore olfattometrico elettronico in dotazione alla scrivente, fino alla data del 31/07/2014, i cui dati di output risultanti sono stati oggetto di un dettagliato rapporto di prova consegnato all'Amministrazione Provinciale e all'ARTA Dipartimento di Teramo.

Monitoraggio olfattometrico
SETTEMBRE 2014

Successivamente, in data 31/07/2014, il Settore Ambiente della Provincia di Teramo, in qualità di Ente autorizzante, inviava alla scrivente una diffida con alcune prescrizioni tecniche, riguardanti principalmente la compartimentazione dei vari settori, da ottemperarsi nel termine di 90 giorni, le quali sono attualmente in fase di esecuzione; in data 10 Settembre 2014 la stessa Amministrazione Provinciale invitava la scrivente ad effettuare un ulteriore periodo di monitoraggio mediante l'utilizzo del sensore olfattometrico in continuo presso il sito della Famiglia De Luca, alla quale veniva richiesta la compilazione di una scheda per il rilevamento degli orari e dell'intensità delle percezioni odorogene, secondo la seguente scala di odori:

Valore 1 **percezione odore debole**
Valore 2 **percezione odore media**
Valore 3 **percezione odore forte**

con richiesta di riferire anche il tempo di percezione del singolo evento, che viene generalmente indicato come presente per un massimo di 5/10 minuti, con l'accordo di avvertire tempestivamente il personale della STAM Srl per la constatazione dell'effettiva presenza di cattivo odore in concomitanza dell'evento segnalato.

Le percezioni olfattive rilevate dalla Famiglia De Luca nel periodo di monitoraggio (11/30 Settembre 2014) sono state le seguenti:

DATA	ORA	DURATA	INTENSITA'	PERCEZIONE
11/09/2014	20	Non continuativa	1	Debole
12/09/2014	19	20-30 minuti	1-1,5	Debole - Media
17/09/2014	19	Non continuativa	3	Forte
18/09/2014	17	Non continuativa	2	Media
19/09/2014	18 e 20	Non continuativa	2	Media
22/09/2014	16-17	Non continuativa	2	Media
24/09/2014	17	Non continuativa	2	Media
29/09/2014	12, 14 e 16	Non continuativa	2	Media

Tali rilevazioni di percezione di odore corrispondono a una percentuale inferiore al 2,5% del tempo totale di rilevamento nella fase di monitoraggio, ma per una corretta procedura di validazione degli eventi è necessario sottolineare che gli stessi non sono mai stati direttamente riscontrati dal personale preposto dalla STAM Srl, in quanto la Famiglia De Luca, contrariamente agli accordi intercorsi, non ha mai provveduto ad inoltrare chiamate telefoniche per le necessarie constatazioni in contraddittorio dell'effettiva presenza di odori molesti.

I dati di output registrati dal naso elettronico EOS 507F di SACMI vengono riportati nelle tabelle di cui alle pagine successive, nelle quali si evidenziano i gradi di percezione di ogni classe olfattiva espressi in concentrazione di Unità Odorimetriche, unitamente alla Temperatura e all'Umidità dell'aria, alla Direzione e alla Velocità del vento, nell'arco temporale giornaliero con scansione temporale di 10 minuti.

Nel caso in esame sono state stabilite le seguenti classi olfattive:

- Biofiltro (riferito alle emissioni dei biofiltri della zona Ossidazione);
- Maturazione (cioè le emissioni dei biofiltri della zona Maturazione 1 e 2);
- UN (non definito), in caso di sostanza sconosciuta al naso; contrariamente al precedente monitoraggio, il sistema è stato impostato per restituire comunque un valore numerico in caso di rilevamento di un impronta olfattiva non riconducibile alle due precedenti;
- AIR (aria pulita).

DETERMINAZIONE DELL'IMPATTO OLFATTIVO

Il monitoraggio effettuato attraverso l'utilizzo del sensore olfattometrico elettronico SACMI EOS 507F consta di oltre 2500 misure, le quali hanno evidenziato quanto segue:

- A) La percentuale di misure in cui il naso elettronico ha attribuito l'aria analizzata alla classe olfattiva "biofiltro" e alla classe olfattiva "maturazione" si attesta per entrambe in un valore inferiore al 1%. Tali percentuali, anche sommate tra esse ($< 2\%$), risultano essere di gran lunga inferiori al limite del 15% sulle immissioni di odore per le zone industriali o agricole. Fissato dalla Linea Guida tedesca del 13 Maggio 1998 "GIRL (Geruch Immission Richt Linie)", che in assenza di normativa specifica italiana può essere assunta come riferimento di valore internazionale; la percentuale di misure in cui il naso elettronico ha attribuito l'aria analizzata alla classe olfattiva "UN", cioè sconosciuta rispetto alle impronte olfattive caratteristiche si attesta in un valore di poco superiore al 3%, per un totale di odori percepiti, riconosciuti e non, di poco inferiore al 5% del totale del tempo di rilevamento;

Tali percentuali appaiono del tutto compatibili con le percezioni olfattive rilevate dalla Famiglia De Luca nel questionario, le quali nel periodo di monitoraggio (11/30 Settembre 2014) corrispondono a una percentuale inferiore al 2,5% del tempo totale di rilevamento nella fase di monitoraggio.

Si tiene a ribadire che gli eventi di percezione di odore registrati da parte della Famiglia De Luca non sono mai stati direttamente riscontrati dal personale preposto dalla STAM Srl, in quanto la Famiglia, contrariamente agli accordi intercorsi, non ha mai provveduto ad inoltrare chiamate telefoniche per le necessarie constatazioni in contraddittorio dell'effettiva presenza di odori molesti.

- B) I venti dominanti rilevati presso il sito monitorato sono indubbiamente quelli provenienti dai quadranti SUD – SUD EST, corrispondenti alla posizione del sito industriale STAM Srl rispetto al punto di misurazione, i quali intensificano la percezione di odori provenienti dal sito produttivo e da tutta la zona industriale Valle Cupa, innescando fenomeni di ricaduta presso la zona in cui è ubicata l'abitazione; nel periodo monitorato si rileva la presenza di un gran numero di misure di venti provenienti dai quadranti NE – NNE, corrispondenti alla zona del Fiume Tronto e delle relative zone industriali presenti al di là di questo, che possono apportare contributi significativi di odori molesti, per la possibile presenza sia di scarichi di reflui non depurati sull'asta fluviale, sia di emissioni in atmosfera da parte di aziende attualmente non identificate ubicate nel territorio della Provincia di Ascoli Piceno; si aggiunga inoltre che il sito in esame è in adiacenza alla Strada Provinciale, ad alto traffico veicolare di mezzi di trasporto con relativi carichi aperti, ed inserito in un contesto di attività agricola, che sono entrambi possibili fonti di cattivo odore,

GRAFICO DIREZIONE VENTI

CONCLUSIONI DELL'ATTIVITA' DI MONITORAGGIO

Dall'analisi dei dati registrati dal sistema SACMI EOS 507F durante il periodo di monitoraggio, e dai riscontri registrati direttamente dalla Famiglia De Luca, si può osservare che l'attività produttiva della STAM Srl genera presso il sito monitorato una situazione di impatto olfattivo irrisorio; presso il sito in questione si rileva rispetto al recente passato un sensibile miglioramento della qualità dell'aria, attribuibile ai lavori di sistemazione eseguiti dalla STAM Srl, la quale, appena venuta a conoscenza dell'esistenza di lamentele, ha provveduto tempestivamente alla ricognizione ed all'eliminazione di tutte le possibili fonti di emissioni diffuse nell'ambiente circostante, mediante l'esecuzione di lavori di manutenzione straordinaria, consistenti nel rifacimento delle sigillature di tutte le tubazioni di estrazione delle arie esauste e di immissione al trattamento di biofiltrazione, e soprattutto nel rifacimento delle chiusure di tutti i possibili punti di perdita sulla copertura superiore del capannone, in particolare sulle guarnizioni dei lucernari e delle onduline, nonché sulle tubazioni della preesistente industria tessile, attualmente inutilizzate (prese d'aria, scarichi vari, camini della centrale termica smantellata); è stata altresì eseguita l'applicazione di diffusori di acqua nebulizzata, addizionata di miscele enzimatico-batteriche miscelate con deodoranti, presso le n. 2 porte delle zone maturazione esistenti sul lato Est del capannone, che talvolta possono essere aperte per l'effettuazione delle operazioni di carico e scarico. Tali operazioni di manutenzione straordinaria hanno quindi avuto un esito risolutivo per l'eliminazione delle lamentele e segnalazioni registrate. Sono altresì in corso di esecuzione ulteriori lavori di miglioramento strutturale, consistenti nel montaggio di chiusure ad impacchettamento rapido presso il portone di ingresso della fase di ricezione, al fine di evitare fuoriuscite accidentali verso l'esterni, e presso i punti di passaggio tra le fasi di ricezione e di ossidazione, e tra le fasi di maturazione e deposito del prodotto finito, al fine di realizzare un efficace compartimentazione delle zone interne di collegamento tra i vari settori.

Sulla base delle rilevazioni del naso elettronico, e direttamente dalla Famiglia De Luca, durante il periodo di monitoraggio, è possibile notare che allo stato attuale:

- l'odore attribuibile all'impianto è in generale valutato come debole;
- esso viene percepito sporadicamente nelle ore pomeridiane e serali, in concomitanza all'inversione delle brezze di mare e di terra lungo l'asse della vallata del Tronto;
- la presenza di odori sconosciuti (UN) per una percentuale del 3% rileva l'esistenza altre fonti odorigene nelle zone circostanti, potenzialmente attribuibili alle motivazione esposte nella pagina precedente.

E' da considerare infine che il coinvolgimento nelle attività di monitoraggio del personale dell'impianto e della popolazione residente ha permesso sia una migliore conoscenza da parte di quest'ultima delle attività svolte presso l'impianto produttivo, ad impatto tossicologico nullo sulla salute umana, nonché la partecipazione attiva al processo di miglioramento degli standard qualitativi delle emissioni odorigene in uscita dall'impianto.
